Aromatic or Aliphatic Binder?

- Aliphatic binder does not go through an 'ambering' phase and is more resistant to chemicals such as chlorine.
- Aliphatic binder is more expensive because of the isocyanates blended into the urethane.
- Aromatic binders have an ambering phase that lasts for a few months, and burns off from UV exposure. This means the playground will have a yellow hue to it for a few months, but will eventually come back to the original color of the EPDM.
